Advantage of Wondfo total antibody testing

Wondfo have high sensitivity while maintaining a high specificity.

COVID-19 Testing Project -Multidisciplinary team of researchers and physicians at UCSF,

UC Berkeley, Chan Zuckerberg Biohub, and Innovative Genomics Institute. - US

Wondfo have high sensitivity while maintaining a high specificity.

earlier intervals (Figure 1B). Four assays (Bioperfectus, Premier, Wondfo, in-house ELISA) achieved >80% positivity in the latest two time intervals (16-20 and >20 days) while maintaining >95% specificity. Some tests were not performed on a subset of specimens due exhausted sample material,

Our data demonstrate specificity greater than 95% for the majority of tests evaluated and >99% for 2 LFAs (Wondfo, Sure Biotech) and the in-house ELISA (adapted from Amanat et al, 2020)[18]. We

The New York Times

Each test was evaluated with the same set of blood samples: from 80 people known to be infected with the coronavirus, at different points after infection; 108 samples donated before the pandemic; and 52 samples from people who were positive for other viral infections but had tested negative for SARS-CoV-2.

Tests made by Sure Biotech and Wondfo Biotech, along with an in-house Elisa test, produced the fewest false positives.

Remarkable results

Chan Zuckerburg Biohub and Massachusetts General Hospital found that only three tests had an accuracy rate of over 99 percent. These were made by Sure Biotech, Wondfo Biotech, and the researchers' in-house. Eight other tests scored 95 percent.

https://www.sciencetimes.com/articles/25498/20200428/experts-identified-one-antibody-test-100-accuracy-0-others-over.htm

Four of the tests produced false-positive rates ranging from 11-16 percent, while many of the rest hovered around 5 percent.

The four tests with the fewest false positives were made made by Sure Biotech, Wondfo Biotech, and two Eliza tests, the researchers said.

A test made by Bioperfectus detected antibodies in 100 percent of the infected samples, but only after three weeks of infection. "None of the tests did better than 80 percent until that time period, which was longer than expected," said Hsu.

4. Discussion

Here, we present results of our post-market validation of the Hangzhou IgG/IgM Rapid Test assays, the Wondfo SARS-CoV-2 Antibody Test and the Hightop SARS-CoV-2 IgM/IgG Antibody Rapid Test. Our findings suggest that the performance characteristics of the Wondfo SARS-CoV-2 Antibody Test and the Hightop SARS-CoV-2 IgM/IgG Antibody Rapid Test are only in keeping with those reported in the IFU if samples collected 14 days or earlier following

A joint venture between The University of Melbourne and The Royal Melbourne Hospital

Wondfo specificity 100%, while sensitivity is on top

and 108 pre-COVID-19 negative controls. The sensitivity of the Wondfo test was 81.5% (95% CI = 70.0–90.1%) among 65 patients with a positive RT-PCR 11 d or more before the test, and the specificity was 99.1% (95% CI = 94.9–100.0%). Of the ten tests studied, the Wondfo test was one of the two lateral flow tests with the best performance. Lastly, we carried out our own validation study, based on 83 volunteers with a positive quantitative RT-PCR result 10 d or more before the rapid test. This analysis showed a sensitivity of 77.1% (95% CI = 66.6–85.6%). We also analyzed 100 serum samples collected in 2012 from participants of the 1982 Pelotas (Brazil) Birth Cohort Study[19] and found 98 negative results, yielding a specificity estimate of 98.0% (95% CI = 93.0–99.8%). By pooling the results from the four separate validations studies, weighted by sample sizes, the sensitivity was estimated at 84.8% (95% CI = 81.4–87.8%) and the specificity was estimated at 99.0% (95% CI = 97.8–99.7%).

Letter to UNCSTD for sharing Guangdong's experience in containing COVID-19 by the scientific and technological method

Confronting with the crisis of the COVID-19 epidemic, the Chinese science and technology experts and personnel are always working in utilizing science and technology to tackle the COVID-19 in the frontline. They reached some scientific and technological outcomes and breakthroughs. In this context, science and technology play a crucial role in preventing and containing epidemics. In respond to the call from the UNCSTD, according to our principle and philosophy of being openness, transparent and sincerity, I would like to introduce several successful practices of Guangdong province in providing technical support for preventing and containing COVID-19 and related medical treatment measures. I would like to express my willingness to share these experiences with our CSTD member states and strengthen the international collaboration in dealing with the COVID-19 epidemic through our joint efforts.

I. **Invent the products for testing COVID-19 in a technological way.** Shenzhen BGI Group developed a new coronavirus nucleic acid detection kit (fluorescent PCR method) which has been applied in more than 70 countries all over the world. The BGI group maintain the competency of producing PCR detection kits for 300 000 persons per day and sequencing detection kits for 10 000 persons per day. BGI has fourteen "Fire Eye" COVID-19 testing laboratories which can test 50 000 persons per day. Daan Gene Co., Ltd of Sun Yat-sen University developed novel coronavirus nucleic acid detection kit and maintains the competency of producing 500 000 PCR detection kits (fluorescent PCR method) per person per day. Guangzhou Wondfo Biotech Co., Ltd developed novel coronavirus antibody detection (colloidal gold method) which was the first approved antibody detection reagent in China, with daily production for 600 000 persons, is able to test novel coronavirus antibody from human body's serum, plasma, and whole blood.

Wondfo application precautions

Window period-- false negative

- The immune system takes time to response and produce enough detectable antibody.
- On the first week symptom onset, the detection rate could be <30%.

Total N=500
Total Positive N=249

		Delay symptoms onset				
		0-5 d	6-10 d	11-15 d	16-21 d	>21 d
WONDFO	N Case sera	30	104	67	38	10
	Case sera testing positive	7.0	78.0	65.0	33.0	10.0
	Sensitivity (%)	23.3	75.0	97.0	86.8	100.0
	IC 95%	9.9 42.3	65.6 83.0	89.6 99.6	71.9 95.6	69.2 100.0

Faint line– even 2 week after symptom

- Most patient are mild symptom, have low antibody level. Wondfo show faint line, need to pay good attention and check carefully.

- Some sample, Igg/Igm separte fail to detect, but Wondfo catch it.

- If using whole blood, must read within 20 minutes, or the background will become red.
- The Igg/Igm separate test show more visible line than Wondfo.

Capillary blood testing

Take blood

Sample loading

Drop buffer

Tips：1. If the sample is collected by digital puncture, use a sterile lancet

2. When piercing the finger, use 70% alcohol to disinfect, wait for it to dry before piercing

3. Results need to wait at least 15 minutes, up to 20 minutes

Precautions for serological testing

Volume 154, Issue 3
September 2020

Article Contents

1 There is compelling evidence that using total antibody or combined IgG/IgM detection offered the highest sensitivity of detection. Data from preliminary studies indicated that additional investigations should examine the clinical correlation of different isotypes and titers to disease severity. 2 It is also clear that the timing of sample acquisition is a crucial determinant of test accuracy, although this important information was not always clearly presented in the current literature.[16] The earliest positive results were reported by day 5 post onset of symptoms, and accuracy peaked by the second week of symptoms. Early in the course of the disease, when RT-PCR sensitivity was reported as 50% to 60%, the concomitant use of serologic tests significantly added sensitivity with consistently reported values over 90%. Moreover, after 10 to 14 days post onset of symptoms, the sensitivity of RT-PCR dropped significantly while serology testing reached its peak. As fully validated methods become commercially available, 3 serology methods may be utilized as an adjunct tool to RT-PCR testing protocols in patients with suspected infection.

Practical Implementation of Serologic Testing

- **Diagnosis in Symptomatic Patients**

The sensitivity of RT-PCR testing decreased over time post onset of symptoms and that this change was observed to be concurrent with the increasing sensitivity of antibody detection methods.

- **Serology Use in Monitoring Disease Course**

Antibody responses may vary according to disease severity, and monitoring titers may be applied in clinical practice to guide earlier aggressive treatment.

- **Serology Use for Screening Asymptomatic Patients**

Implementation of serology testing to screen the general population and asymptomatic health care workers is currently of significant interest. Nonetheless, the available evidence is limited to support its use in these scenarios.

- **Utility for Possible Convalescent Serum Donors**

Understanding the utility of routine serologic methods (ie, ELISA, CLIA) in the prediction of convalescence is complex. Further comprehensive studies in this area are warranted.
